### **1. Introduction**

The authors in the present paper are describing the *subanta* and *tinanta* analysis systems for Sanskrit which are currently running at

\_\_\_\_\_\_. Sanskrit is a heavily inflected language, and depends on nominal and verbal inflections for communication of meaning. A fully inflected unit is called *pada*. The *subanta padas* are the inflected nouns and the *tinanta padas* are the inflected verbs. Hence identifying and analyzing these inflections are critical to any further processing of Sanskrit.

The results from the subanta analyzer for the input text fragment

```
***आम्रस्य आत्मकथा***
```

चपलाः बालकाः आम्राणाम् उद्यानं गच्छन्ति । तत्र आम्रफलानि पश्यन्ति प्रसन्नाः च भवन्ति ।

are displayed as follows -

आम्रस्य\_SUBANTA\_SUBANTA आत्मकथा [आत्मकथा (स्त्रीलिङ्ग) + सु, प्रथमा, एकवचन] [\*\_PUNCT] चपलाः [चपल (पुल्लिङ्ग) + जस्, प्रथमा, बहुवचन] बालकाः [बालक (पुल्लिङ्ग) + जस्, प्रथमा, बहुवचन] आम्राणाम् [आम्र (पुल्लिङ्ग) + आम्, षष्ठी, बहुवचन] उद्यानं [उद्यन्+अम्, द्वितीया, एकवचन] [गच्छन्ति\_VERB] [I\_PUNCT] [तत्र\_AV] आम्रफलानि [आम्रफल+जस्/शस् प्रथमा/द्वितीया, बहुवचन] [पश्यन्ति\_VERB] प्रसन्नाः [प्रसन्न (पुल्लिङ्ग) + जस्, प्रथमा, बहुवचन] [च\_AV] [भवन्ति\_VERB] [I\_PUNCT]

Those colored blue are non *subanta* categories and those colored red are possible errors. The default black colored ones are the *subanta* padas analyzed.

The word गच्छन्ति from the above input text resulted in the following output from the *tinanta* analyzer system –

गच्छन्ति { ( कर्तृवाच्य ) गम् ( [ भ्वादिगण ] [ अनिट् ] [ सकर्मक ] ) ( [ लट् ] ) झि ( [ परस्मै ] [ प्रथम–पुरुष ] [ बहृवचन ] ) }

## 2. The Subanta Anlyzer

The system accepts unicode (UTF-8) sandhi-free Devanagari Sanskrit inputs (word, sentence or text) and processes it according to the following sequence -

The PREPROCESSOR does the simplification and normalization of the Sanskrit text (for example, deletes Roman characters, other invalid words, punctuations etc). The POS TAGGER identifies four categories AVyaya, VERB, PUNCTuation and SUBANTA. The SUBANTA RECOGNIZER does *vibhakti* identification and isolation by searching the *vibhakti* database. The SUBANTA ANALYZER does analysis by checking the *subanta* rule base and sandhi rules. Analysis includes splitting the NPs into its constituents - base [(*prātipadika*) (PDK)], case-number markers (*kāraka-vacana-vibhakti*).

### 3. Sanskrit sentence and basic POS categories

A Sanskrit sentence has NPs (including AVs), and VPs. Cardona<sup>1</sup> (1988) defines a sentence as -

$$(N - E^n) p \dots (V - E^v) p$$

After *sup* and *tin* combine with PDK, they are assigned syntactico-semantic relation by the  $k\bar{a}raka$  stipulations to return complete sentences.

<sup>&</sup>lt;sup>1</sup> George Cardona, 1988 Pāņini, His Work and its Traditions, vol ... i (Delhi: MLBD, 1988)

### 3.1 Sanskrit subanta (inflected nouns)

Sanskrit nouns are inflected with seven case markers in three numbers. Potentially, a noun can be declined in all three genders. Sanskrit noun forms can be further complicated by being a derived noun as primary (*kṛdanta*), secondary (*taddhitānta*), feminine forms (*strīpratyayānta*) and compounds (*samāsa*). They can also include *upasargas* and AVs etc. According to Pāṇini, there are 21 case suffixes called *sup* (seven *vibhaktis* combined with three numbers)<sup>2</sup>, which can attach to the nominal bases (PDK) according to the syntactic category, gender and end-character of the base. Pāṇini has listed these as sets of three as:

su, au, jas am, auț, śas țā, bhyām, bhis ne, bhyām, bhyas nasi, bhyām, bhyas nas, os, ām ni, os, sup<sup>3</sup>

for singular, dual and plural<sup>4</sup> respectively. These suffixes are added to the PDKs<sup>5</sup> (any meaningful form of a word, which is neither a root nor a suffix) to obtain inflected forms NPs. PDKs are of two types: primitive and derived. The primitive bases are stored in  $ganap\bar{a}tha$  [(GP) (collection of bases with similar forms)] while the latter are formed by adding the derivational suffixes. NPs are of mainly six types –

## **3.1.1** *avyaya subanta* (indeclinable nouns)

Avyaya subanta, remain unchanged under al morphological conditions<sup>6</sup>. According to Pāņini  $[2.2.82]^7$ , affixes  $c\bar{a}p$ ,  $t\bar{a}p$ ,  $d\bar{a}p$ , (feminine suffixes) and sup are deleted by luk when they occur after an AVs. Pāņini defines AVs as svarādinipātamavyayam [1.1.36], kŗnmejantaḥ [1.1.38], ktvā tosun kasunaḥ [1.139] and avyarābhāvaśca [1.1.40]<sup>8</sup> etc.

# 3.1.2 basic subantas (primitive nouns)

Basic *subantas* are formed by primitive PDKs found in the Pāṇini's *gaṇapāṭha*. For our purpose, all those nouns, the base or inflected form of which can be found in a lexicon can be considered basic *subantas*. Sometimes, commonly occurring primary or secondary derived nouns, feminine or compound forms can also be found in the lexicon. Therefore such *subantas* are also considered basic and do not require any reverse derivational analysis unless specifically required.

<sup>2</sup> स्वौजसमौट्छष्टाभ्याम्भिस्ङेभ्याम्भ्यस्ङसिभ्याम्भ्यस्ङसोसांङ्योस्सुप्

<sup>3</sup> सुपः

<sup>&</sup>lt;sup>4</sup> द्र्येकयोर्दिवचनैकवचने

<sup>&</sup>lt;sup>5</sup> अर्थवधातुरप्रत्ययः प्रातिपदिकम् ।१।२।४५॥, कृत्तद्धितसमासाश्च ।१।२।४६॥

<sup>&</sup>lt;sup>6</sup> सदृशं त्रिषु लिङ्गेषु सर्वासु च विभक्तिषु ।

वचनेषु च सर्वेषु यन्न व्येति तदव्ययम् ॥ [गोपथ ब्राह्मण]

<sup>&</sup>lt;sup>7</sup> अव्ययादाप्सुपः [२.४.८२]

<sup>&</sup>lt;sup>8</sup> स्वरादिनिपातमव्ययम् [१.१.३६], कृन्मेजन्तः [१.१.३८], क्त्वा-तोसुन्-कसुनः [१.१.३९], अव्ययीभावश्च [१.१.४०]

Such inflected nouns are formed by inflecting the base or PDKs (*arthavadadhāturapratyaya*<sup>h</sup>, *prātipadiakam*) with *sup*. For example: *rāma*<sup>h</sup>, *syāma*<sup>h</sup>, *pustakālaya*<sup>h</sup>, *vidyālaya*<sup>h</sup> etc.

### 3.1.3 samāsānta subanta (compound nouns)

Simple words (*padas*), whether substantives, adjectives, verbs or indeclinables, when added with other nouns, form *samāsa* (compound). Sanskrit *samāsas* are divided into four categories, some of which are divided into sub-categories. The four main categories of compounds are as follows:

- adverbial or *avyayībhāva*,
- determinative or *tatpurusa*,
- attributive or *bahuvrīhi* and
- copulative or *dvandva*. *dvandva* and *tatpuruşa* compounds may be further divided into sub-categories

### 3.1.4 krdanta subanta (primary derived nouns)

The primary affixes called *krt* are added to verbs to derive substantives, adjectives or indeclinables.

# 3.1.5 taddhitanta subanta (secondary derived noons

The secondary derivative affixes called *tadduita* derive secondary nouns from primary nouns. For example - *dāśarathī*, gauna etc.

## 3.1.6 strīpratyayānta subanta (femijīne derived nouns)

Sanskrit has eight feminine suffixes *tāp*, *cāp dāp*, *nīṣ*, *nīn*, *nīp*, *un* and *ti* etc. and the words ending in these suffixes are called *strīpratyayānta* For example - *ajā*, *gaurī*, *mūṣikā*, *indrānī*, *gopī*, *aṣtādhyāyī*, *kurucarī*, *yuvatī*, *karabhorū* etc.

### 4. Recognition of Sanskrit *subanta*

### **4.1 Recognition of punctuations**

System recognizes punctuations and tags them with the label PUNCT. If the input has any extraneous characters, then the input word will be cleaned from these elements (i.e. 'normalized') so that only Devanāgarī Sanskrit input text is sent to the analyzer. For example, " $\pi/\&^{2}@\#$ ;  $\pi$ ,":-= $\overline{ma}$ :"  $\rightarrow$   $\pi$ ;  $\overline{ma}$ :

## 4.2 Recognition of Avyayas

System takes the help of *avyaya* database for recognizing AVs. If an input word is found in the AVs database, it is labeled AV, and excluded from the *subanta* analysis as AVs do not change forms after *subanta* affixation. We have stored most AVs in the *avyaya* database.

## 4.3 Recognition of verbs

System takes the help of verb database for verb recognition. If an input is found in the verb database, it is labeled VERB and thus excluded from *subanta* analysis. Since storing all Sanskrit verb forms is not possible, we have stored verb forms of commonly used 450 verb roots.

## 4.4 Recognition of *subanta*

Thus, a process of exclusion identifies the nouns in a Sanskrit text. After the punctuations, *avyayas* and verbs are identified, the remaining words in the text are labeled SUBANTA.

## 5. Analysis of *subanta*

System does analysis of inflected nouns with the help i two relational database - examples and rules. Brief description of these databases follows-

## 5.1 Example database

All complicated forms (which are not analyzed according to any rule) including those of some pronoun are stored the database. For example: अहम्=अस्मद+सु प्रथमा एकवचन;अहं=अस्मद+सु प्रथमा एकवचन;आवाम्=अस्मद+औ प्रथमा द्वितीया द्विवचन;आवां=अस्मद+औ प्रथमा द्वितीया द्विवचन;वयम्=अस्मद+जस प्रथमा बहुषचन;वयं=अस्मद+जस प्रथमा बहुवचन;माम्=अस्मद+अम द्वितीया एकवचन;मां=अस्मद+अम द्वितीया स्निचचन

## 5.2 Rule database

The *subanta* patterns are stored in this database. This database analyzes those nouns which match a particular pattern from the rule base. For example, राम:, नदी, रमा, पुस्तकम etc. First, the system recognizes *vibhakti* as the end character of nouns. For example, ':' is found in nominative singular (1-1) like -राम:, श्याम:, सर्व:, भरत: एक: . The system isolates ':' and searches for analysis in the *sup* rule base. In the case of nominative and accusative dual (1-2/2-2), PDK forms will be ''' ending, for example - रामो, श्यामो, सर्वो, एको. The system isolates ''' and searches for analysis by matching in the rule database. The sample data is as follows –

ा=ा+सु प्रथमा एकवचन;ाभ्याम्=+भ्याम् तृतीया चतुर्थी पञ्चमी द्विवचन;ाभ्यां=+भ्याम् तृतीया चतुर्थी पञ्चमी द्विवचन;भ्याम्=+भ्याम् तृतीया चतुर्थी पञ्चमी द्विवचन;भ्यां=+भ्याम् तृतीया चतुर्थी पञ्चमी द्विवचन;भ्यः=+भ्यस् चतुर्थी पञ्चमी बहुवचन;भ्यः=+भ्यस् चतुर्थी पञ्चमी बहुवचन;

## 5.3 verb data sample

भवति,भवतः,भवन्ति,भवसि,भवथः,भवथ,भवामि,भवावः,भवामः,भवतु,भवताम्,भवन्तु,भव,भवतम्,भवत,भवतम्,भवत्,भवानि,भवाव, भवाम,अभवत्,अभवताम्,अभवन्,अभवः,अभवतम्,अभवत,अभवम्,अभवाव,अभवाम,भवेत्,भवेताम्,भवेयुः,भवेः,भव ोतम्,भवेत,भवेयम्,भवेव,भवेम,बभूव,बभूवतुः,बभूवुः,बभूविथ,बभूवथुः,बभूव,बभूव,बभूविव

## 5.4 avyaya data sample

अ,कश्चित्,सदैव,अकस्मात्,अकाण्डे,अग्निसात्,अग्नी,अघोः,अङ्ग,अजस्रम्,अञ्ज्सा,अतः,अति,अतीव,अत्र,अथ,अथ् ाकिम्,अथवा,अथो,अब्दा,अद्य,अद्यापि,अधरात्,अधरेद्युः,अधरेण,अधः,अधस्तात्,अधि,अधिहरि,अधुना,अधोऽधः,अध्यय ानतः,अनिशम्,अनु,अनेकधा,अनेकशः,अन्तः,अन्तरेण,अन्यतः,अन्यत्,अन्यत्र

## 5.5 Architecture of the system

The following model describes the interaction between multi-tiered architecture of the *subanta* analyzer:

## 5.6 Front-end: online interface

The Graphical User Interface (SUI) is produced by JSP (Java Server Pages). The JSP interface allows the user to give input in Devanagari utf-8 format using HTML text area component. The user interface is displayed as follows:

	.ac.in/subanta/rsubanta.jsp
<ul> <li>संस्कृत सुबन्त पहचान ययं</li> </ul>	Tagra 🛉 Add Tab

	सङ्गणक द्वारा सुबन्त पहचान और प्रकृति-प्रत्यय विभाग
	(Sanskrit Subanta Recognizer and Analyzer)
	How does it work Limitations of this work
	The "Sanskrit Subanta Recognizer and Analyzer" is a result of the research carried out by <u>Subhash</u> <u>Chandra</u> (M.Phil. 2004-2006) under the supervision of <u>Dr. Girish Nath Jha</u> for the award of M.Phil. degree. The coding for the application was done by Dr. Girish Nath Jha.
	सुबन्त पहचान एवं प्रकृति-प्रत्यग विभाग के लिये कृपया संस्कृत पद, वाक्य या गय लिसे (Devanagari unicode only) cut & paste test data from here
	A A A A A A A A A A A A A A A A A A A
	प्रकृति-प्रत्यय विभाग के लिये यहाँ क्लिक करें
Back-end: datab	ase / txt files

There are two versions of the system; the server-based version connects to a MS-SQL Server 2005 RDBMS through JDBC. The rule base, example base and other linguistic resources are stored as Devanagari utf-8. The PC based portable version, for obvious reasons, cannot have RDBMS support. Therefore, we have for rules and data stored in utf-8 text files as backend. A design of the reverse *subanta* database is given below-

The *supRuleBase* table has relations with the *exceptionList* table. Any exception figuring in the rule base must have a description in the exception list. The table *supExampleBase* depends on the exceptionList and must provide analysis for each example figuring in the exceptionList and marked in the supRuleBase. The dhāturūpa object depends on the dhātupātha object while the AVs is a floating object as of now. These linguistic resources are checked for recognition of nouns, and the rules and example bases are searched for analysis. System uses some text/data files whose samples have been given in earlier sections.

## **5.2 Database connectivity**

The database connectivity is done through Java Database connectivity (JDBC) driver. JDBC Application Programming Interface (API) is the industry standard for database independent connectivity for Java and a wide range of SQL databases. JDBC technology allows using the Java programming language to develop 'write once, run anywhere' capabilities for applications that require access to large-scale data. JDBC works as bridge between Java program and Database. SQL server 2005 and JDBC support input and output in Unicode, so this system accepts unicode Devanagari text as well as prints result in unicode Devanagri too<sup>9</sup>. John K.

## 6. Limitations of the system

## 6.1 Limitations of the recognition process

This system has the following recognition limitations:

- at present, we have approximately verb forms for only 450 commonly found verb roots in the verb database. Though it is very unlikely that ordinary Sanskrit literature will overshoot this list, yet the system is likely to start processing verb forms as nouns if not found in this limited database.
- at this point, the system w@ wrongly mark prefixed or derived verb-forms as nouns as they will not be found in the verb database. The gains from the *tinanta* analyzer will be added here shortly to overcome this limitation.
- currently this work as sandhi-free text. So, a noun or verb with sandhi is likely to return wrong result. The gains from a separate research on sandhi processing will be used to minimize such errors.
- currently, our AV database has only 519 AVs. It is not enough for AV recognition in ordinary Sanskrit literature. In this case, the system is likely to start processing AVs as nouns, if it is not found in AVs database.
- some forms ending in primary affixes look like nouns while they are AVs. For example: पठितुम, गत्त्वा, आदाय, विहस्य etc. System will incorrectly recognize and process them as subantas.
- many nouns (for example, *satr pratyayānta* in locative singular) look like verbs. These will be wrongly recognized as verbs for example: भवति, गच्छति, पठति, चलति etc. To solve this problem, we will have a hybrid POS category called SUPTIN for those verb forms which are *subantas* as well.

<sup>&</sup>lt;sup>9</sup> http://java.sun.com/products/servlet/

#### 6.2 Limitations of the analysis process

The system has the following analysis limitations:

same forms are available in the dual of nominative and accusative cases, for example, रामौ, dual of instrumental, dative and ablative cases, for example रामाभ्याम्, plural of dative and ablative cases, for example रामेभ्यः, dual of genitive and locative cases, for example रामयोः. In neuter gender as well, the nominative and accusative singular forms may be identical as in पुस्तकम् (1-1 and 2-1). In such cases, the system will give all possible results as in

रामौ	=	औ	[प्र./ द्वि. द्विव.]
रामाभ्याम्	=	भ्याम्	[तृ./च./पं. द्विव.]
रामेभ्यः	=	भ्यस्	[च./पं. ब्रहेष.]
रामयोः	=	ओस्	[ष./र्स द्विव.]
पुस्तकम्	=	सु/अम्	[फ्र. रिंद्र. एकव.]
हरेः	=	ङसि/ङस्	[प./ष. एकव.]
		,	A.

some krdanta forms (generally lyap, tumun and ktvā suffix ending) look like nouns (for example - विहस्य पठित्वा, गत्वा, पठितुम्, गत्नम, नेतुम्, प्रदाय, विहाय etc.). In such cases, the system may give wrong results as:

विहस्य = विह + ङस् षष्ठी एकवचन पठित्वा = पठित्वा + स्र प्रथमा एकवचन गत्वा = गत्वा + सु पर्धमा एकवचन पठितुम् = पठितु - अम् द्वितीया एकवचन गन्तुम् = गन्तु - अम् द्वितीया एकवचन

- at this point, system does not have gender information for all PDKs, nor does it attempt to guess the gender. This limitation is going to be minimized by plugging in the *amarakośa* shortly.
- currently this system is giving multiple results in ambiguous cases, because the words as analyzed a single tokens. This will be solved by adding the gains from the research on *kāraka* and gender of nouns which concluded recently.

### 7. The *tinanta* analyzer

Verbs constitute an important part of any language. A sentence indispensably requires a verb to convey complete sense. Given the importance of verb and verb phrases in any linguistic data, it is necessary to develop a proper strategy to analyze them. Creating lexical resource for verbs along with other parts of speech is a necessary requirement. Sanskrit is a highly inflectional language. It is relatively free word-order language. The semantic inter-relation among the various components of a sentence is established through the inflectional suffixes.

Scholars have done efforts to analyze Sanskrit verb morphology, both in theory and in computation. Some of the major works are listed below:

- Gerard Huet has developed a lemmatizer that attempts to tag inflected Sanskrit verbs along with other words. This lemmatizer knows about inflected forms of derived stems which are not apparent in the display of the main stem inflection. It, however, does not attempt to lemmatize verbal forms with pre-verbs but only invert root forms. The site also provides a long list of the conjugated forms of verb roots in the present, imperfect, imperative, optative, perfect, aorist and future teases as a PDF document.
- *Prajna* project of ASR Melkote claims to be module generation and analysis of 400 important Sanskrit roots in three voices (Active, Passive and Impersonal), 10 lakāra, 6 tense and 4 moods,
- Aiba (2004) claims to have developed a Verb Analyzer for classical Sanskrit which can parse Sanskrit verb in Present, Aorist, Perfect, Future, Passive and Causative forms. This site actually works only for some verbs and accepts that the results are not reliable,
- Desika project of TDIL, Govt. of India claims to be an NLU system for generation and analysis for plain and accented written Sanskrit texts based on grammar rules of Pāṇini's Aśṭādhyāyī. It also claims to have a database based on Amarakośa and heuristics based on Nyāya & Mīmāmsā Śāstrat and claims to analyze Vedic texts as well,
- RCILTS project at SG&SS, JNU has reportedly stored all verb forms of Sanskrit in a database,
- *Śābdabodha* project of TDIL, govt. of India claims to be an interactive application to analyze the semantic and syntactic structure of Sanskrit sentences,
- The ASR Melcote website reports that a Sanskrit Authoring System is under development at C-DAC Bangalore. The system is supposed to make making tools for morphological, syntactic and semantic analyses with word split programs for sandhi and *samāsa*.
- Cardona (2004) discussed Pānini's derivational system involving aspect of linguistics, grammar and computer science.
- Whitney (2002) listed all the quotable roots of the Sanskrit language together with the tense and the conjugation system.
- Mishra and Jha (2004) describe a module (Sanskrit *Kāraka* Analyzer) for identification and description of *kāraka* according to *Pāninian kāraka* formulations.
- Edgren (1885) discussed verb roots of Sanskrit language according to Sanskrit grammarians.
- Joshi (1962) presented linguistic analysis of verb and nouns of Sanskrit language

• Jha and Mishra (2004) proposed a model for Sanskrit verb inflection identification that would correctly describe verbs in a laukika Sanskrit text. They presented a module to identify the verb by applying Pāṇini rules in reverse with the help of a relational database.

This module can also be used to identify the types of sentences as active or passive voice with complete reference of the verb.

Present work, which owes a lot to above listed efforts, has some specific features such as:

- The system takes into account the  $P\bar{a}ninian$  analysis and develops its methodology by applying it into reverse direction.
- It aims at developing a comprehensive strategy so that any *tinanta* can be analyzed with the same technique.
- It can be further expanded and modified to recognition and analysis of denominatives
- it is an online servlet-unicode database system with input-output in unicode only

The front-end of	f the <i>tinanta</i> analyzer is as follows -

## 8. Sanskrit verb-morphology

Verbs have been of central importance to Sanskrit grammarians.  $Y\bar{a}ska$  insisted so much on them that he propounded that all the nominal words are derived from verb roots. Verbs convey the sense of becoming<sup>10</sup>. Sanskrit follows a well defined process in the formation of *padas*. Both noun *padas* (*subanta*) as well as verb *padas* (*tinanta*) have to undergo certain inflectional

<sup>&</sup>lt;sup>10</sup> bhāvapradhānamākhyātam (Yāska, Nirukta)

processes in which various nominal or verbal affixes are added to nominal or verbal base word in order to obtain noun and verbal forms. The process is however more than mere addition as there may occur certain morphophonemic changes in the base as well as in the affix in the process resulting in a usable form. The verb forms are derived from verb-roots or *dhātus*. These *dhātus* are encoded with the core meaning of the verb. These can be primitive<sup>11</sup> or derived<sup>12</sup>. Primitive verb-roots, which are around 2000 in number, have been listed in a lexicon named *dhātupāțha*. They are divided in 10 groups called *gaṇas*. All the verb-roots of a group undergo somewhat similar inflectional process. Derived verb-roots may be derived from primitive verb-roots or from nominal forms. Prefixes also play an important role as they can change the meaning of a verb root. These roots then have to undergo various inflectional suffixes that represent different paradigms. In this process, the base or root also gets changed. The chart given on the next page gives an overview of Sanskrit verb roots.

- **Causals** (*nijanta*) The causals are formed by adding affix *nic* to a primitive verb root. They convey the sense of a person or thing causing another person or thing to perform the action or to undergo the state denoted by the root.
- **Desideratives** (*sannanta*) Desiderative of a primitive verb root is formed by adding affix *san* to it. It conveys the sense that a person or thing wishes to perform the action or is about to undergo the state indicated by the desiderative form. Any basic verb-root or its causal base may have a desiderative form.
- **Frequentatives** (*yañanta*) Frequentative verbs import repetition or intensity of the action or state expressed by the root from which it is derived. They can be of two types
  - o Atmanepada Frequentative (yananta) affix yan is added
  - o Parasmaipada Frequentative (yanluganta) affix yan is added but deleted

<sup>11</sup> bhūvādayo dhātavah (Pāņini 1/3/1)

<sup>&</sup>lt;sup>12</sup> sanādyantā dhātavah (Pāņini 3/1/32)

An illustration is given below of formation of derived verb-roots from a primitive verb root  $bh\bar{u}$ .

These derived verb-roots, however, undergo similar operations, with some specifications, to form verb forms.

#### 8.1.2 those derived from nominal words

A large number of Sanskrit verb-forms can be derived from nominal words. These are known as *nāmadhātus* (denominatives). Taking a nominal word as head, various derivational suffixes are added to these to form nominal verb-roots. The sense conveyed by the nominal verb root depends upon the suffix added to it. Yet, denominatives commonly import that a person or thing behaves or looks upon or wishes for or resembles a person or thing denoted by the noun. These denominatives, however, can be innumerable as there is no end to nominal words in Sanskrit.

## 8.2 Process of formation of Sanskrit verb forms

A Sanskrit verb root may take various forms in different inflectional paradigms. Sanskrit has ten *lakāras*, i.e. four moods (Indicative Imperative, Optative, and Subjunctive) and six tenses (Present, Imperfect, Perfect, Distant Future, Future and Aorist). The *lakāras* are named in C-V-C format. The first consonant l signifies that the suffix has to be replaced by *tin* terminations further. The vowels *a*, *i*, *o*, *u*, *e*, *o*, *r* distinguish one *lakāras* from another. Last consonant, either *t* or *n*, signifies different operations. These *lakāras* are added to the root, as primary suffixes, so that it denotes a meaning in the particular tense or mood indicated by that particular *lakāra*.

Verb inflectional terminations or conjugational suffixes are 18 in number. These are divided in two groups – *Parasmaipada* and *Ātmanepada*, each having 9 affixes – a combination of 3 persons x 3 numbers. Thus each of the 18 terminations expresses the voice, person and number. A verb is conjugated in either *pada*, though some of the roots are conjugated in both. For each different *lakāra*, a root is affixed with these 9 terminations in a single *pada*. Again, there are three voices- Active, Passive and Impersonal. Transitive verbs are used in the Active and Passive voices while intransitive verbs are conjugated in the Active and Impersonal voices. The 18 inflection terminations are basically replacement of the *lakāra* or primary suffix. According to Pāṇini, when a *lakāra* is added to a root, it is replaced by 18 terminations. Thereafter, one of the 18 remains to create a verb form.

For each separate *lakāra*, the 18 *tin* terminations are replaced by other forms, an illustration of the replacement technique of Pāṇini. Thus *ti*, *tu*, *tā*, *t* etc. are the various replacements of same affix tip in the environment of different *lakāras*.

Then we have certain characteristics (*vikarana*) inserted between the root and the termination. This characteristic can vary according to  $lak\bar{a}ra$  or the class of the verb root. For four of the  $lak\bar{a}ras$ , we have *sap* as a characteristic – only for four *ganas*.

Addition of one or more of 22 prefixes (*upasargas*) to verb roots can result in more variety of forms. Derivative verb roots, both derived from verb roots as well as nominal words, also follow the same process to form verb forms. There can be some specific rules and exceptions in some cases. The following tree gives a rough estimate of all the possible verb-forms of Sanskrit.<sup>13</sup>.

The verb roots of different *gaṇas* adopt certain terminations when *tin* affixes are added to them. Consequently, the verb roots of these classes form verbal bases ending in *'a'*. The *tin* affixation also influences the verb root and it undergoes several morpho-phonemic changes, for example, having *guṇa* operation on the ere vowel. The verb root can adopt certain more operations resulting in the final verb-form.

As shown in an example, when suffix *tip* is added to verb-root  $bh\bar{u}$ , we obtain *bhavati* as the final verb form. This *bhavati* can be analyzed in *bhav* + *a* + *ti*. Here *bhav* is the prepared verbal base whereas *a*+*ti* is the combination of 'characteristic + conjugational affix.' This can be cited as a common analysis of most Sanskrit verb forms. The verbal base of a verb root remains same in all its forms whereas the second combination is common for almost all the roots of a single *gaṇa*. The analysis applies to the first category of derived verb roots as well.

### 9. Analysis of Sanskrit verb forms

### 9.1 Strategy for regular verb forms

The simplest strategy for regular verb forms can be to store all the possible forms of all the verb roots in any structured form. But given the enormity of Sanskrit verb-roots and the multiplicity of inflectional paradigms, this approach is far from being practical. A better approach may be arrived at by following the analytical method.

As illustrated above, Sanskrit verb forms are a blend of multiple morphemes which contain relevant information. Analytically, we can say that the first element is the conjugational affix that remains at the end of every verb form. These affixes have encoded information of *pada* (though it is determined by the root), *lakāra*, person and number. Thus terminations can serve as the most important thing to let us know about the paradigm information of any verb form. They can be a tool to identify a verb form in a given text. The terminations, as they are basically replacements of 18 original *tin* affixes in different *lakāras*, differ among themselves according to the *lakāra*. However, in each *lakāra* they are similar for all the verb toots of various groups, leaving some exceptions. So, *ti* can be used to identify any verb form of gaṇas. Then again, the terminations may be changed due to morphophotenic environment, *tā* affix of *luț lakāra* changing to *țā* with roots like *yaj*.

Further left we have the remaining morphemes of the various characteristics and increments inserted between the verb root and terminarions, in the process of their formation explained above. So, *bhvādigaņa* verb forms, in conjugational *lakāras*, have 'a'- a result of *sap* characteristic; *svādi* roots have *no*, *nu* or *nv* - all of them remaining morphemes of *snu*. Some roots like that of *adādi* have no such characteristic sign infixed in them.

Then we have the modified stepp of the verb root at the right end of the verb form. The modification can be that of *guna*, *vrddhi* or any other. Generally a root adopts a common stem in all the forms for both the *badas* in conjugational *lakāras*. So, *bhav* is the stem for all the *parasmai* forms in the conjugational *lakāras*. But there are exceptions to it to the extent that four or five types can be found among nine forms of a single *lakāra-pada*.

Here, the first morpheme- the *tin* termination is common among all the verb forms of a particular *pada-lakāra*-person-number combination. Second constituent- the characteristic (existing in the form of its remaining morpheme) and increments inserted in between may differ, yet being almost the same in a particular group. The third constituent- the modified verb-root is particular in the strict sense. In the analysis, the recognition of the *tin* termination will identify a word as a verb form and find out its *pada-lakāra*-person and number. The second morpheme can, in many cases, be helpful to recognize the *gaṇa* of a particular root because the characteristics in a *lakāra* are determined by the *gaṇa* that the root belongs to.

Thus the core of the analytical approach is that each *tinanta* verb form can be analyzed to form a unique combination of verbal stem + *tin* termination; and we store both of these constituent parts in separate tables. So, when it is to be analyzed, its constituent morphemes are recognized and identified with the help of pre-stored structured data.

An example of this strategy is shown in the table given below. The first column demonstrates the representative verb root of each class. When the verbal affix *tip* is added to each of them, it undergoes certain morphological operations and results in the usable *tinanta* verb form listed in the second column. This is the forward Pāṇinian process. The next column demonstrates the reverse Pāṇinian approach for analysis of verb forms. In the second column every form has *ti* ending. When we remove this ending along with the conjugational affix, we obtain the storable verbal base. Every verb form can be analyzed similarly in ending and remaining verbal base.

Verb-root		Verb-form		Verb-base
$bhar{u}$		bhavati		bhav (-ati)
ad		atti		at(-ti)
hu		juhoti		juho(-ti)
div		dīvyati		dīvy(-ati)
SU	+ $ti \rightarrow$	sunoti	- $ti \rightarrow$	sun(-oti)
tud		tudati		tud(-ati)
chid <sup>14</sup>		chinatti		chinat(-ti)
tan		tanoti	4.	tan(-oti)
krī		krīņāti	· ~ ·	krī(-ņāti)
cur		corayati	4	coray(-ati)

### 9.2 database for verb analysis

The database tables given below demonstrate the structure of storage of all possible verbal bases of a verb root. As a sample data, five verb roots of different *gaņas* have been taken -

	<u> Xtable: verb bases</u>												
root	gaņa	pada	seţ/	lakāra	Verbal Bases								
			aniț/		Regular	Causal	Desider.	Freque	entative

				lun	adev	4	-										
The second both <i>padd</i>	The second table illustrates the structure of the storage of verbal terminations of five ganas in both padas for lat lakāra. More than one termination in a single box has been separated.																
lakāra	pada	/gaņa	ı 🗌	II	ber:	II	per.	akāra pada/gana I per. II per. III per.									

	•		
4 - L.	 	- <u>cc</u>	
тяn	vern	attives	
un		amaco	

lakāra	pada/gaṇa		pada/gaṇa I per		II per.			III per.			
			Sing	Dual	Plu.	Sing.	Dual	Plu.	Sing	Dual	Plu.
laț	arasm ai		ti/ ati/	dāḥ/ ataḥ/ utah	nti/ anti /van	si/ṣi/ asi/ asi/o	thaḥ/ athaḥ/ uthah	tha/ atha/ utha	mi/ āmi/ omi	vaḥ/ āvaḥ /uva	āmaḥ / mah/
	þ		TI)	•	ti	si/osi				ķ	umaḥ
	ātmane		te/īte /ūte ute/ īte	ete aate/ īyāte/ uvāte	ante / ate/ īyat e/uv ate	se/ īșe/ ușe ase	ethe/ āthe/ īyāthe/ uvāthe	adhve / īdhve / udhve	e/ īye/ uve	āvah e/īva he/u vahe	āmah e/īma he/u mahe
laṅ	paras		t/at	tām/ atām	n/an	ḥ∕aḥ	tam/ atam	ta/ ata	m/a m	āva	āma
	ātmane		ata	etām/	anta	athā <u>ḥ</u>	ethām	adhv am	е	āvah i	āmah i

luṅ	ŝm	īt	iṣṭām	iṣuḥ	īḥ	iṣṭam	ista	iṣam	iṣva	ișma
	paras									
	ātmane	i <u>ș</u> ța	iṣātā m	işat a	iṣṭhā ḥ	iṣāthā m	idhva m/idh vam	iși	ișvah i	ișma hi

For identification and analysis, the suffixes should be given a descending character sequence. So *ti* of *isyati* in *bhavisyati* cannot create any ambiguity.

### **10.** Problems and possible solutions

- Verb forms which have no mark of termination left in the end are difficult to identify with the proposed module. So *bhava*, *babhūva* and other alike forms are to be stored separately.
- Some forms which are not *tinanta* but are similar to them like *bhavati*, *bhavata*, which are singular and dual of *bhū* in present *porasmai* third person, and also locative singular and ablative/relative singular of nominar root *bhavat*. The resolution of ambiguity here will demand involvement of semantic and syntactic analysis.
- Denominatives are formed by deriving verbal base from nominal base with the help of affixes such as *kyac*, *kāmyee*, *kyaṣ*, *yak*, *kyan* etc. and then adding various verbal terminations to these verbar bases. Thus they undergo same operations and processes as regular and derived verb forms. Still there analysis is difficult due to two reasons. Firstly, nominal bases can be innumerable and thus the above stated strategy of storing the bases of all the nominative verbal bases is impossible in this case. One has to follow the rule based analytical approach. The verbal terminations can be determined with the help of affix tables as denominatives are affixed with same verbal affixes. The remaining base, however, has to be analyzed in order to infer the nominal base of that denominative. As there are some common rules to derive the verbal stem from nominal base, we can develop an analysis rule based module to identify the nominal root and can find its meaning with the help of a lexicon.
- Addition of prefixes to the verbal bases may cause morphological as well as semantic change to a verbal form. To identify one or more prefix in a verbal form, all the prefixes have to be stored in a database table along with their meaning. The system will have to check the input verbal form from left to identify single or combined prefixes. A prefix can happen to completely modify the meaning of a verb. So, creating a separate table that stores the altered meanings of various roots, when affixed with certain prefix, may be helpful in this case.

#### **11. Conclusion**

The proposed strategy to analyze Sanskrit verb forms in given text is different from existing works in many ways. It works with a reverse Pāņinian approach to analyze *tinanta* verb forms into there verbal base and verbal affixes. The methodology accepted to create database tables to store various morphological components of Sanskrit verb forms is clearly in line with the well defined and structured process of Sanskrit morphology described by Pāṇini in his *Aṣtādhyāyī*. It comprehensively includes the analysis of derived verb roots also. Even in the case of verb roots derived from nominal words, the table of affixes can provide assistance in order to separate the denominative verbal base from the verbal terminations.
